SYSTEM TEN THE VERSATILE BATCH PROCESSING SYSTEM

Speedy batch processing is a natural application for System Ten. It is the **modular** small computer, the **flexible** small computer. It starts where you are today—and expands to take care of tomorrow's business:

Choose the configuration that suits you best: punched cards, punched paper tape, magnetic tape, on-line disc storage—use any or all of these with System Ten.

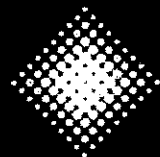

Place each peripheral where it will fit into your work flow best. System Ten peripherals can go almost anywhere: into your payroll department, your shipping department, your sales department, wherever the work is. And a simple two-wire, above-floor line is all the connection you need for remote units. So, whenever you want, it's easy to relocate peripherals.

Select from the System Ten family only those peripherals that you currently need. Additional peripherals may be added in the future for additional applications or increased business.

Operate System Ten as a powerful stand-alone system. Or use it as a satellite, communicating with larger computers.

System Ten is the computer that works for you. You don't work for it. And it starts working the first day—at change-over time—by drastically reducing your conversion problems.

Smaller business, larger business—whichever you are, System Ten offers you computing power that you can **use**. Plus, significant potential for your future.
